

ARTICULATED JOINT FOR KNEE BRACE COMPRISING MEANS
FOR OPERATING THE SAME

ABSTRACT

An articulated joint (10) for a post-operative knee brace or for articular walkers in general, of the type designed to form an articulated connection between a pair of uprights (11,12) each of which can be applied to two sectors of the body joint to be treated, is described. Power-driving means for the angular movement of one upright with respect to the other are fitted at the hinge point connecting the two uprights.
